

Problem A. Exponentiation

Time Limit 1000 ms

Mem Limit 524288 kB

Your task is to efficiently calculate values a^b modulo $10^9 + 7$.

Note that in this task we assume that $0^0 = 1$.

Input

The first input line contains an integer n : the number of calculations.

After this, there are n lines, each containing two integers a and b .

Output

Print each value a^b modulo $10^9 + 7$.

Constraints

- $1 \leq n \leq 2 \cdot 10^5$
- $0 \leq a, b \leq 10^9$

Example

Input	Output
3	81
3 4	256
2 8	921450052
123 123
